# 1 a-c) image of active site of the three taken crystal structures with the ligand, in standard orientation

colours, orientation, labels, stereo? labels: S1, S2, S3

## thrombin

thrombin model 3 1c4u, A89

## trypsin

trypsin-model-del-ions 102r, A17

## urokinase

model7-10wd 10wd, A32

### Figure 1:

View into the active site of the used receptor models of thrombin, trypsin and urokinase. The residues Ser195, His57 and Asp102 of the catalytic triads as well as Asp189 at the bottom of the S1 are labelled. The ligands (A89, A17, A32), coloured in pink, are representing orientation taken from the original crystal structure conformation where the models based on (thrombin: 1c4u; trypsin: 1o2r; urokinase: 10wd).

## 3. r2, q2

### Figure 3:

The coefficients of determination R2 and the predictive correlation coefficient Q2 for the three COMBINE models were plotted in dependency of the number of latent variables (LV). The best Q2-LOO values for thrombin, trypsin and urokinase were 0.89 (LV5), 0.83 (LV3), and 0.68 (LV4). In trypsin, variable selection did not improve the model, but in thrombin and urokinase the models could be improved by using D-optimal pre-selection (D-opt) and fractional factorial design (FFD) variable selection at LV4. For thrombin LV4 and LV5 resulted in nearly the same values so the lower one was chosen (see table).

| model     | variable  | LV | R2   | SDEC | Q2   | SDEP | Q2   | SDEP |
|-----------|-----------|----|------|------|------|------|------|------|
|           | selection |    |      |      | LTO  | LTO  | LOO  | LOO  |
| thrombin  | -         | 4  | 0.93 | 0.59 | 0.81 | 1.00 | 0.82 | 0.98 |
|           | D-opt LV4 | 4  | 0.96 | 0.46 | 0.88 | 0.79 | 0.89 | 0.77 |
|           | FFD LV4   | 5  | 0.97 | 0.40 | 0.89 | 0.77 | 0.89 | 0.76 |
| trypsin   | -         | 3  | 0.90 | 0.72 | 0.82 | 0.97 | 0.83 | 0.97 |
|           | D-opt LV3 | 3  | 0.90 | 0.73 | 0.83 | 0.97 | 0.83 | 0.97 |
|           | FFD LV3   |    |      |      |      |      |      |      |
| urokinase | -         | 4  | 0.83 | 0.62 | 0.62 | 0.93 | 0.63 | 0.91 |
|           | D-opt LV4 | 4  | 0.84 | 0.60 | 0.67 | 0.87 | 0.68 | 0.86 |
|           | FFD LV4   |    |      |      |      |      |      |      |

## 4. a-c) REC curves training xray, training docked, testset active docked

Pseudo training sets: docking of ligands, which were already used in training sets for model building.

### Figure 4:

In the Regression Error Characteristic Curves (Bi and Bennett, 2003) the error tolerance, defined as the absolute difference between the experimental and predicted  $\Delta G$ , is plotted versus the points predicted within the tolerance. The 'training-xray' curves base on the internal prediction of the crystal structure ligand conformations used as a training set. The error tolerance of the null model is calculated of the absolute difference between experimental  $\Delta G$  and the average of it. The rest of the curves are retrieved from the best ranked predicted  $\Delta G$  values. The ranking was performed according to highest GoldScoreFitness (best GoldS), smallest error (best abs), lowest  $\Delta G$  bind elec of UHBD (best dG bind elec), lowest RMSD (best RMSD) of the ten docking solutions. The curves 'x. ranked pred dG' were calculated after ranking the ten predicted  $\Delta G$  values for each ligand (lowest first) and selecting the x. ranked value. The median is taken from all ten values.

 $\frac{absolute(\Delta G_{experimental} - \Delta G_{predicted})}{pseudo \ test \ set}$ 

| urokinase           | r2   | r2spearman | SDEP |
|---------------------|------|------------|------|
| xray before var sel | 0.83 | 0.90       | 0.61 |
| xray                | 0.84 | 0.90       | 0.60 |
| GoldS               | 0.14 | 0.33       | 2.12 |
| best abs            | 0.65 | 0.81       | 0.98 |
| best dG bind elec   | 0.18 | 0.35       | 2.13 |
| best RMSD           | 0.20 | 0.41       | 2.23 |
| 1.                  | 0.25 | 0.47       | 2.51 |
| 2.                  | 0.25 | 0.53       | 2.27 |
| 7.                  | 0.15 | 0.28       | 1.79 |
| 10.                 | 0.15 | 0.29       | 1.80 |
| mean                | 0.21 | 0.40       | 1.84 |
| median              | 0.19 | 0.35       | 1.80 |
| null model          |      |            | 1.49 |

after variable selection (ffd4)

mean of experimental=-8.91

standard deviation of the experimental  $\Delta G = 1.54$
